The Problem

Today, GE HealthCare's Portrait Mobile, a wireless patient monitoring ecosystem requires an installation process that:

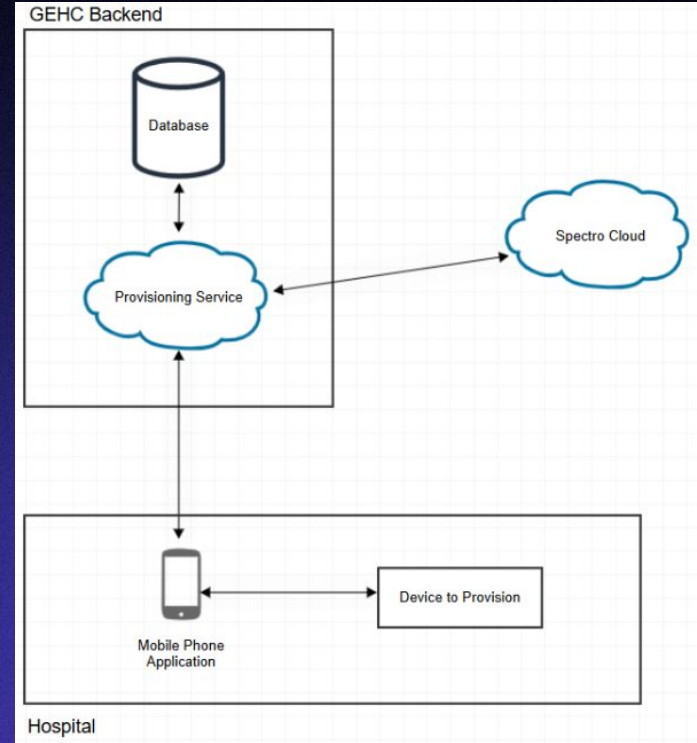

- Is extremely manual.
- Is error prone.
- Is time consuming.
- Requires the expertise of knowledgeable network professionals.

The Solution

We are creating a mobile phone app that will interact directly with the “off the shelf” device to be provisioned directly at the customer site simply by turning on the device and configuring it via the app. This will support true “last minute” provisioning. The Target Users for this app are field engineers working at GE-Healthcare.

Tech Stack:

- Postgres 15
- Node/Express
- React Native
- BLE

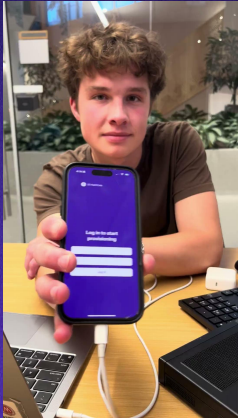

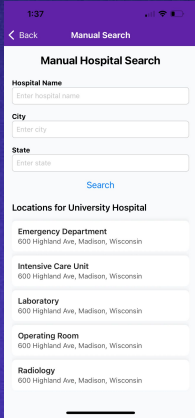

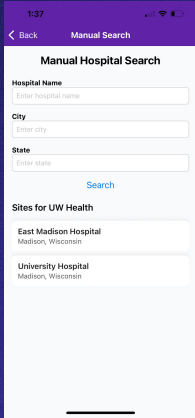

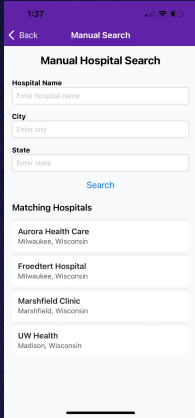

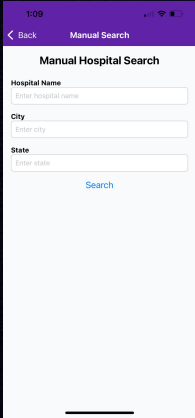

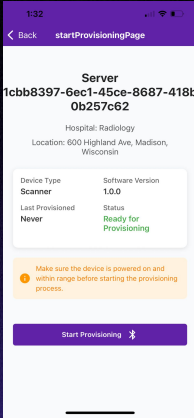

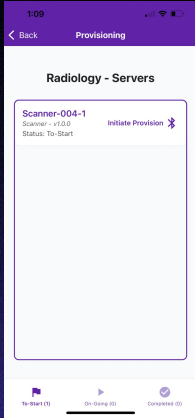

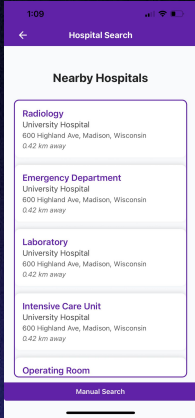

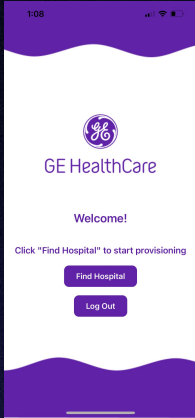

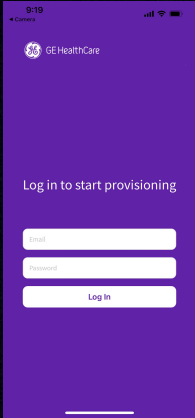

Demo

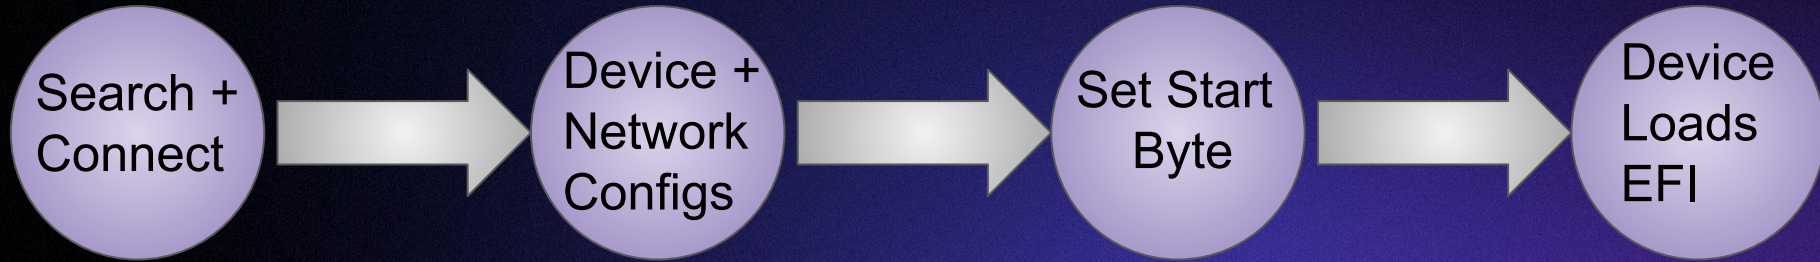

Major updates from the last demo

- Updated the app to have a more professional and interesting look.
- Added working authentication.
- Implemented Bluetooth to get the main functionality of the app working.
- Fully integrated the frontend and the backend.

Demo

Bluetooth Stack

Conclusion - Most Valuable Takeaways From the Class

- Developed the ability to divide long-term goals into manageable weekly milestones to maintain consistent progress throughout the project.
- Learned how to coordinate in a group by dividing tasks so everyone had a clear focus, ensuring all goals were met.
- Built a better understanding of the different versions of the professional software development cycle and how to implement them
- Worked with new and different technologies and learned how to integrate them together
